SI Table 1. Genes upregulated ($\geq 3x$) during U(VI) reduction after 6 and 11 hours (T1

and T2). The brighter the red color is, the greater the fold upregulation. The average fold upregulation for both time points and standard deviations are shown on the right. ND refers to no data. Genes included in this list were upregulated $\geq 3x$ at either or both time points. The genes are listed in order of decreasing upregulation at either time point. The functions listed correspond to: cyt: cytochrome and heme synthesis; hyp: hypothetical; sec: secretion; me: membrane; str: stress; tr: transcription and translation; mot: motility; nrg: energy production; un: unknown.
